                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, colymerase chair reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The color independence and sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as complement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymolectide sequences have applications in clasponstics, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amine acid sequences and approach of the invention.

Note: The sequence data for this patent did not appear in the printed configuration, in for while and not expressive the energy of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

ADD08345-AAD08394 represent cDNAs corresponding to 50 human secreted protein genes and AAE03898-AAE03947 represent the proteins they encode. C AAE03948-AAE03996 represent human secreted protein fragments or variants. C AAE03948-AAE03996 represent human secreted protein fragments or variants. The genes and their secreted proteins are useful for preventing, treating or ameliorating medical conditions can be disapposed by determining the c amount of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 50 genes, based on the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of proliferative disorders, cancer, tumours, foetal and developmental abovementalities, haematopoietic disorders diseases of the immune system, AIDS, autoimmune diseases (e.g., rheumatoid arthritis), inflammation, allergies, neurological disorders (e.g., Alzheimer's disease, C Parkinson's disease), cognitive disorders, schizophrenia, asthma, c satiovascular disorders angiogenic disorders, kidney disorders, skin disorders (e.g., psoriasis), sepsis, diabetes, and infections. The proteins can also be used to aid wound c healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell

AAE03946 represent human secreted protein fragments or variants. The genes and their secreted proteins are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Pathological conditions can be diagnosed by determining the amount of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 50 genes, based on the tissues in which they are most highly expressed,
culture of primary tissues, to regenerate tissues, to identify their cognate ligands or binding partners, and in chemotaxis, and can be used as a food additive or preservative to modify storage properties.

Antibodies specific for a protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, and immunosoratic immunosasys e.g., radioimmunoassay or enzyme linked immunosorbent assay (ELISA). The present sequence represents a human secreted protein of the invention.

proteins or their active domains. The polypeptides, polynucleotides and antibodies raised against the polypeptides are used in a method of creatment of amammal and prevention of disorders caused by the aberrant protein expression or activity. The polypeptides can be used as molecular weight markers, food supplements, and in antibody production. The polypeptides are used to identify compounds which bind to the polypeptides. Polynucleotides of the invention are used as probes and primers, for sequencing, for chromosome or gene mapping, in the production of recombinant proteins, and in generating anti-sense DNA or RNA and fin gene therapy. Polypeptides of the invention can be used to target drugs to a tumour, in assays to determine biological activity, to raise antibodies/elicit an immune response, to determine quantitative protein levels, as tissue markers, and to isolate receptors or ligands. Polypeptides of the invention may also be useful in treating platelet disorders, etem cell disorders, regenerating bone, cartilage, tendon, ligament and/or nerve tissue, wound healing, treating burns, promoting the provise and function of alsorders and envised and osteoarthritis, an emana.

Alzheimer's, Parkinson's and Huntington's diseases, amylotrophic lateral or function or from any resulting from bacterial, viral or function or firm any resulting from bacterial, viral or firm any resulting from bacterial.

fungal infection or from autoimmunity, cancer, allergy, asthma, graft-versus-host disease, eczema, haemophila, thrombosis, anti-inflammatory diseases, nervous system disorders, and infection. The present sequence represents a protein of the invention.

```
and include developing products for the diagnosis or treatment of proliferative disorders, cancer, tumours, foetal and developmental abnormalities, haemacopoietic disorders, diseases of the immune system, AIDS, autoimmune diseases (e.g., rheumatoid arthritis), inflammation, allergies, neurological disorders (e.g., Alzheimer's disease, settofammation, calergies, neurological disorders, schizophrenia, asthma, skin disorders (e.g., psoriasis), sepais, diabetes, artherosclerosis, skin disorders, angiogenic disorders, kidney disorders, angiogenic disorders, kidney disorders, cardiovascular disorders, pregnancy-related disorders, endocrine disorders, and infections. The proteins can also be used to aid wound challing and epithelial cell proliferation, to prevent skin aging due to subburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues, to identify their contains or binding partners, and in chemotaxis, and can be used as a food additive or preservative to modify storage properties.

Antibodies specific for a protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, and in diagnostic immunoassays e.g., radioimmunoassay or enzyme linked im diagnostic immunoassays e.g., radioimmunoassay or enzyme linked immunosorbent assay (ELISAA). The present sequence represents a human secreted protein fragment referred to in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

                                                                                                                                                                                                                                                   AAU01119-AAU01149 represent novel Streptococcus pyogenes virulence proteins #1-31. The S. pyogenes virulence genes can be used to proteins #1-31. The S. pyogenes virulence genes can be used to produce attenuated microorganisms comprising a mutation that disrupt the expression of the virulence protein. The virulence genes, proteins or an attenuated microorganism or ordering; the proteins themselves, an attenuated microorganism or a vaccine comprising the virulence protein are useful for the manufacture of a medicament for use in the treatment or prevention of a condition associated with infection by Streptococcal or gram-positive bacteria, for veterinary treatment, and in a screening assay for the identification of an antimicrobial drug. Disorders which can be treated using S. pyogenes virulence polymolecities and polypeptide sequences include non-invasive infections and invasive infections etc. The virulence proteins are also useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

Streptococcus/GBS (Streptococcus adalactise) or group A streptococcus/GBS (Streptococcus/GBS (Streptococcus/GBS (Streptococcus/GBS (Streptococcus/GBS (Streptococcus/GBS), comprising one of 5483 sequences (S1), given in the specification. The proteins have entibacterial and antiinflammatory activity. (I), nucleic acids encoding (I), ABN66044-ABN71256 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment to r prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactise and S. pyrogenes. Nucleic acids encoding (I) are used to detect Streptococcus in a biogical sample. (I) is used to detect Streptococcus in a biogical sample. (I) are used to detection or disease caused by the specific or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity chromatography, immunoassays, and distinguishing/identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                     infection
                                                                                                                                                                                                                                                                                                                                                                                                                                          New Streptococcus protein for the treatment or prevention of infection or disease caused by Streptococcus bacteria, such as meningitis, and for detecting a compound that binds to the protein -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a protein (ABP25413-ABP30895) from group B

The invention relates to modulating NF-kappaB (NF-kB) induction in a cell comprises contacting a cell with an anti-inflammatory compound (ABB08725-AB808742) comprising at least one NEWO binding domain (ABB77313). The compound has acts through selective inhibition of the compound has acts through selective inhibition of the compound in inhibition of IKCDeta kinase activation and subsequent decreased phosphorylation of IKCDeta kinase activation of NEWO interaction results in inhibition of IKCDeta kinase activation and subsequent decreased phosphorylation of IKCDeta kinase activation and creation treated to rindirectly) by blocking the interaction results in inhibition of IKCDeta kinase activation of NEWO interaction. The compound is useful in treating NR-KB mediated care differentiation. The compound is useful in treating observation to conditions, where the condition is an inflammatory disorder, an autoimmune disease, tatansplant rejection, osteoporosis, cancer, alto antoimmune disease, tatansplant rejection, osteoporosis, cancer, alto anaphylaxis, cutaneosclerosis, a viral infection or ataxia calmaged darbritis, outsneovel inflammatory disorder is asthma, alleagies, utilicaria, anaphylaxis, cutaneous inflammatory disease, vasculitis and bursitis. The inflammatory disease, vasculitis and chronic obstructive pulmonary disease, vasculitis and spondylatrhitis, psoriatis arthritis, psoriatis, psoriatic arthritis, psoriatis, crepobluinamia or multiple sclerosis. For chronic viral infections caused by Epstein-barr, cytomegalovirus or herpes simplex. Other viral colseases include HIV and influenza. The compound may also be useful for treating anaphylaxis, drug and food sensitivity, contact dermatitis, munosuppression in which orticosteroids are used, including inmunor aging. The compound may be used to replace corticosteroids in munical munical personal continuation of including domain of IKKDeta.

The compound may be administered alone or in combination is that of a mutated NEWO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            · rd

The invention relates to an antiinflammatory compound (especially AAM48629-AAM48645), comprising a membrane translocation domain (AAM48620-AAM48620). Comprising a membrane translocation domain (AAM48620-AAM48620). The AAM48651 which comprises from 6-15 amino acid residues, fused to a NEWO binding sequence (AAM48525-AAM48619). The antiinflammatory compounds have antiasthmatic, antibacterial, immunosuppressive, dermatological, neuroprotective, nootropic, antiatherosclerotic, virucide and antiallergic activity. The compounds act as selective inhibitors of cytokine-mediated NEKappaB crimate by blocking interaction of IkappaB kinase beta (IKKObeta kinase activation and subsequent decreased phosphorylation of IkappaB. The compounds are useful for treating inflammatory disorders, e.g. asthma, ung inflammation or cancer, psoriasis, rheumatoid arthritis, osteoarthritis, inflammatory bowel disease, sepsis, vasculitis, bursitis; autoimmune diseases such as lupus, polymyalgia, scleroderma, cannulatione and siseases such as lupus, polymyalgia, scleroderma, at telanulationed subsequent decreased processis; viral infections; and ataxia telanulations are also useful for treating compounds are also useful for treating compounds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                antirheumaric; antiarthritis; osteopathis; antibacterial; virucide; immunosuppressive; dermacological; neuroprotective; antiarherosclerotic; antiallergic; membrane translocation domain; NEMO binding domain; eczema; cytokine; NRkappaB; IkappaB kinase beta; IKKbeta; cancer; psoriasis; rheumatoid arthritis; osteoarthritis; inflammatory bowel disease; autoimmune disorder; multiple sclerosis; transplant rejection; osteoporosis; Alzheimer's disease; atherosclerosis; viral infection; ataxia telangiectasia; allergy; anaphylaxis; arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel antiinflammatory compound comprising membrane translocation domain fused to NEMO binding sequence, useful for blocking nuclear factor kappaB activation, and for treating asthma, lung inflammation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                pro-inflammatory responses such as allergies, urticaria, anaphylaxis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        drug or food sensitivity, eczema, dermatitis, sunburn, aging and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       kinase activation; leukocyte; inflammation; B-selectin; osteoclast; autoimmune disease; transplant rejection; osteoporosis; cancer; Alzheimer's disease; viral; infection; asthma; anaphylaxis; psoriasis; rheumatoid arthritis; Crohn's disease; multiple sclerosis; HIV; corticosteroid; immunosuppression; antiinflammatory; immunosuppressive; osteopathic; cytostatic; nootropic; neuroprotective; anti-HIV; human;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to antiinflammatory compounds comprising NEMO binding domain (NBD) peptides. The NEWO binding domains are found on IkappaB kinase-beta (IKMCALs) and IkappaB kinase-beta (IKMCALs) and IkappaB kinase-alpha (IKMCALs) and IkappaB kinase-alpha (IKMCALs) are useful for modulating nuclear factor-kappaB (NF kappaB) induction in a cell, where the compounds are capable of blocking the interaction in a cell, where the compounds are sapable of blocking the interaction come in a si IKMCALsha or IKKObeta, and NEMO. The antiinflammatory compound further comprises at least one membrane translocation domain. The compounds are useful for treating inflammatory disorders, autoimmune diseases, osteoporosis, cancer, althamatory disorders, autoimmune diseases, osteoporosis, cancer, telangiectesia, and for transplantation detection. The compounds of the invention block NF-kappaB induction by IKK but do not inhibit the basal activity of NF-kappaB. ABU08412 represent human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The invention relates to modulating NF-kappaB (NF-kB) induction in a cell comprises contacting a cell with an anti-inflammatory compound C Comprises Comprising at least one NRMO binding domain (ABB0877313). The compound has acts through selective inhibition of Cytokine-mediated NF-kB activation by blocking the interaction of NEWO with IKKbeta at the NEWO binding domain. Blockage of IKKbeta-NEWO interaction results in inhibition of IkkappaB. The compound may also act (directly or indirectly) by blocking the recruitment of leukocytes into sites of acute and chronic inflammation, by down-regulating the expression of B-selectin on leukocytes or by blocking osteoclast of expression of B-selectin on leukocytes or by blocking osteoclast differentiation. The compound is useful in treating NF-kB mediated conditions, where the condition is an inflammatory disorder, an autoimmune disease, transplant rejection, osteoporosis, cancer, altachimer's disease, atherosclerosis, a viral infection or ataxia curticaria, anaphylaxis, cutaneous inflammation, sepsis, psoriasis, curticaria, anaphylaxis, cutaneous inflammation, sepsis, psoriasis, cremanic obstructive pulmonary disease, vasculitis and bursitis. The inflammatory disorder is athmitis, inflammatory conventivities, psoriatic arthritis, lupus and bursitis. Also for Crohn's disease, ulcerative colitis, cremay polymyapida, scleroderma, Wegner's granulomatosis, temporal arteritis, psoriatic arthritis, lupus and spondylarthritis, dand influenza. The compound may also be dermatitis, cremay polymyapida, cremayeria, drug and food sensitivity, contact dermatitis, cused by Epstein-barr, cytomegalovirus or herpes simplex, opter viral diseases include HIV and influenza. The compound may also be useful for treating anaphylaxis, drug and food sensitivity, contact dermatitis, may any any any any and any any and any any and any any and any any and any any any and any any and any any any and any any any and any any any and any any any any and any any any and any any any any and any any any an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            immunosuppression in transplants and cancer therapy. Also for identifying antiinflammatory compounds and for diagnosis of an inflammatory disorder. The compound may be administered alone or in combination with other known anti-inflammatory agents. The present sequence is that of an IKKbeta mutant, useful in examples of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Modulating NF-kappaB induction in a cell, useful for treating e.g. inflammatory disorders, osteoporosis and cancer, comprises contacting a cell with an anti-inflammatory compound comprising at least one NEMO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Note: The present sequence is not given in the specification but is derived from GenBank Accession No. 014920 (ABB77294).

```
tissue (and some also in testis and breast cancer tissue). The products tissue (and some also in testis and breast cancer tissue). The products of the invention can be used for gene therapy. (A) are used (i) for recombinant expression of polypeptides (B) and (ii) to isolate complete genes. (B) are used (i) to identify agents suitable for treatment of ovarian cancer. (ii) directly for treating this form of cancer.

Cincluding expression from gene therapy vectors) and (iii) for generation of specific antibodies. (A) are identified by assembling ESTS (expressed sequence tags) from a particular tissue type before comparison of expression patterns. This allows a significantly longer fragment of the gene to be revealed, so should reduce the number of failures associated with the fact that ESTS from different libraries may represent different parts of the same unknown gene, distorting the estimated frequency of occurrence in a particular tissue. AAY5605-Y76638 represent protein fragments encoded by the human ovarian tumor CDNA library derived EST

The present invention describes a novel result macaque realizable tradition describes a novel realizable macada mulatta rhadinovirus 17577 (RRV). AAC64754 represents the called macada mulatta rhadinovirus 17577 (RRV). AAC64754 represents the encoded by the genome sequence. The present invention also specifically claims the individual open reading frame (ORF) nucleotide sequences from the genome which encode the individual proteins, but these sequences from the genome which encode the individual proteins, but these sequences are not given. A non-human animal infected with RRV can be used for testing the fficacy of drug in the treatment of condition associated with infection with RRV such as Kaposi's sarcoma, lymphopproliferative disorders, B-cell hyperplasia, lymphadenopathy, splenomegaly, hyperplasia, lymphadenopathy, splenomegaly, hypergammaglobinulinaemia or autcoimmune haemolytic anaemia, by administering the drug to a immuno-compromised non-human primate preferably Rhesus macaque monkey obtained by as a result of infection by Simian Immunodeficiency Virus (SIV). RRV is useful for producing non-human primate madel for testing potential treatments for conditions associated with RRV infection. It is also useful for testing the sesociated with RRV infection by administering the vaccine to the subject capable of infection with RRV incculating the subject with RRV and observing the effect of vaccine. AAC64755 to AAC64755 and AAB53205 to AAB53213 represent sequence used in the exemplification of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (1)
amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic
activity, and can be used in gene therapy and vaccine production. (I)
proteins and polynucleotides may be used in the prevention, diagnosis and
treatment of diseases associated with inappropriate (I) expression. For
example, they may be used to treat disorders associated with decreased
expression by rectifying mutations or deletions in a patient's genome
that affect the activity of (I) by expressing inactive proteins or to
supplement the patients own production of (I). Additionally, (I)
polynucleotides may be used to produce the secreted (I), by inserting
polynucleotides may be used to produce the secreted (I), by inserting
the nucleic acids into a host cell and culturing the cell to express the
protein. (I) proteins and polynucleotides may be used to prevent,
diagnose and treat immune/haematopoietic-related diseases, especially
cancers and cancer metastases of haematopoietic antigen genomic
sequences from the present invention. AAK64942 to AAK84950 and AAM82169
represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Macaca mulatta rhadinovirus 17577; RRV; rhesus macaque rhadinovirus; genome; Kaposi's sarcoma-associated herpesvirus; KSHV; interleukin 6; IL-6; macrophage inflammatory protein; MIP; diagnosis; vaccine; cytostatic; anti-HIV; gene therapy; infection; Kaposi, s sarcoma; lymphoproliferative disorder: B-cell hyperplasia; lymphadenopathy; splenomegaly; hypergammaglobinulinaemia, autoimmune haemolytic anaemia.

New isolated human secreted protein for diagnosing, preventing, treating or ameliorating medical conditions and used as a food additive or preservative

Example 1; SEQ ID No 360; 129pp; English.

The invention relates to an isolated protein that is one of 186 human secreted proteins, given in the specification, encoded by one of 180 colors secreted proteins, given in the specification, encoded by one of in a pharmaceutical composition under treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, degs, chickens or sheep. Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders and sogenesis, nervous system disorders e.g. Alzheimer's disease, infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection. The polypoptides can also be used to aid wound the maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypoptides can also be used as a food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, cofactors and other nutritional components. The present sequence represents one of the novel human

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Bscherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneunoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins. The protein can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella promoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to soreen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.
                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Carr GJ;

The present invention describes a polynuclectide (I) comprising a sequence of a Bifidobacterium genome selected from the nuclectide sequence given in ABQ81842 and ABQ81843, or a sequence given in ABQ81842 and ABQ81843, or a sequence sibribiting at least 90% identity or which hybridises with the sequences given in ABQ81843. Also described is a polynuclectide (II) encoding a fusion protein, comprising a sequence selected from 1097 sequences given in ABB65258 to ABB66354 ligated in frame to a polynuclectide adventing a heterologous polypeptide. (I) has antidiarrheic and antidiarchial activities, and can be used as an inhibitor of Salmonella. (I) (which is a probe) is useful for the detection and/or identification of Bifidobacterium longum in a blological sample. A carrier containing the lactic acid bacterium Bifidobacterium longum NCC2705 (CNCM 1-2618) can be used for preventing and/or treating diarrhoes brought about by pathogenic bacteria and/or rotavirus. The carrier is a food composition selected from milk, yogurt, curd, cheese, fermented milks, milk based fermented products, infant formula, per food or a pharmaceutical composition selected from tablets, liquid bacterial suspensions, dried oral cappensent, wet oral supplement, dry tube feeding or wet tube feeding. (I) is useful in DNA arrays or chips to carry out analysis of the expression of the Bifidobacterium gene. ABQ81844 to ABQ81850 represent Bifidobacterium related nucleotide sequences given in the Sequence
                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Bifidobacterium longum NCC2705, Bifidobacterium, bacterial; antidatarhal; antidaterial; inhibitor of Salmonalla; detection; identification; lactic acid bacterium; diarrhoea; pathogenic bacteria; rotavirus; food composition; pharmaceutical composition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel polynucleotide comprising Bifidobacterium genome sequence useful as a probe or primer for detecting and/or identifying Bifidobacterium

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to modulating NF-kappaB (NF-kB) induction in a cell comprises contacting a cell with an anti-inflammatory compound (ABB08725-ABB08742) comprising at least one NEWO binding domain (ABB77313). The compound has acts through selective inhibition of cytokine-mediated NF-kB activation by blocking the interaction of NEWO with IKKbeta at the NEWO binding domain. Blockage of IKKbeta-NEWO interaction results in inhibition of IKKbeta Kinase activation and subsequent decreased phosphorylation of Ikkbeta Kinase activation and subsequent decreased phosphorylation of IkappaB. The compound may also act (directly or indirectly) by blocking the recruitment of leukocytes into sites of acute and chronic inflammation, by down-regulating the expression of E-selectin on leukocytes or by blocking osteoclast
                             N.B. The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied by the European Patent Office.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              IKKbeat; IKKalpha; NEMO; NEMO binding domain; NBD; NF-kappaB; NF-kB; kinase activation; leukocyte; inflammation; E-selectin; osteoclast; autoimmune disease; transplant rejection; osteoporosis; cancer; Alzheimer's disease; viral; infection; asthma; anaphylaxis; psoriasis; rheumatoid arthritis; Crohn's disease; multiple sclerosis; HIV; corticosteroid; immunosuppression; antiinflammatory; immunosuppressive; osteopathic; cytostatic; nootropic; neuroprotective; anti-HIV; human; antiarteriosclerotic; virucide; antiasthmatic; antiallergic; dermatological; antibacterial; antibsoriatic; antirheumatic; antirheumatic; antiarthritic; osteopathic; antiulcer.

differentiation. The compound is useful in treating NF-kB mediated conditions, where the condition is an inflammatory disorder, an autoimmune disease, transplant rejection, osteoporosis, cancer, alizheimer's disease, atherosclerosis, a viral infection or ataxia talaries. Alizheimer's disease, atherosclerosis, a viral infection or ataxia telangiectasia. The inflammatory disorder is asthma, allergies, urticaria, anaphylaxis, osteoarthritis, psoriatic arthritis, inplammatory bowel disease, chronic obstructive pulmonary disease, vacculitis and bursitis. The inflammatory disorder may also be dermatitis, eczema, spondylarthritis, psoriatic arthritis, lupus and spondylarthritis. Also for Crohy Granulomatosis, temporal arteritis, polymyalgia, scleroderma, Wegner's granulomatosis, temporal arteritis, cayoglobulinaemia or multiple sclerosis. For chronic viral infections caused by Epstein-barr, cytomegalovirus or herpes simplex. Other viral diseases include HIV and influenced. He used to replace corticosteroids in any application in which corticosteroids are used, including including liminamatory compounds and for diagnosis of an inflammatory disorder. The compound may be administered alone or in combination with other known anti-inflammatory agents. The present sequence is that of the NEWO binding domain of IKKDeta.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             87.5%; Score 35; DB 23; Length 6; 83.3%; Pred. Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                   The invention relates to modulating NF-kappaB (NF-kB) induction in a cell comprises contacting a cell with an anti-inflammatory compound (ABB77313). The compound has acts through selective inhibition of (ABB77313). The compound has acts through selective inhibition of NEWO with Interaction results in inhibition of IXCDeta kinase activation and subsequent decreased phosphorylation of IXCDeta kinase activation and compound is useful in treating NP-KB mediated attifectly) or indirectly) by blocking the recruitment of leukocytes or by blocking osceoclast differentiation. The compound is useful in treating NP-KB mediated conditions, where the condition is an inflammatory disorder, an autoimmune disease, transplant rejection osteoporosis, cancer, altaheimer's disease, transplant rejection, osteoporosis, cancer, altaheimer's disease, transplant rejection, osteoporosis, cancer, anaphylaxis, cutaneous inflammatory disorder, an autoimmune disease, transplant proprieting pooriatic arthritis, inflammatory conditions and inflammatory disorder and activities, understing and burstits. The inflammatory disorder may also be dermatitie, obscrawi, pooriasis, osteoarthritis, psoriatic arthritis, lugus and spondylatthritis psoriatic arthritis, lugus and spondylatthritis psoriatic arthritis, lugus and spondylatthritis psoriatic arthritis, lugus and spondylatthritis also for Cromb edisease, ulcerative colitis, polymyalgia, scleroderma, Wegner's granulomatosis, temporal arteritis, caused by Epstein-barr, cytomegalovirus or herpes simpled HIV and influenza. The compound may be useful for treating anaphylaxis, drug and food sensitivity, contact dermatitis mumunosuppression in transplants and care therespy. Also for identifying mumunosuppression in transplants ar

(AAM48620-AMM48645), comprising a membrane translocation domain.

(AAM48620-AMM48645) or AAM48646-AAM48651) which comprises from 6-15 amino acid residues, fused to a NEWO binding sequence.

(AAM48525-AAM48619). The antiinflammatory compounds have antiasthmatic, cytostatic, antipsoriatic, antiinflammatory compounds have antiasthmatic, antibsoriatic, antiinflammatory of compounds act as selective inhibitors of cytokine-mediated NFkappaB activation by blocking interaction of IkappaB kinase beta (IKKbeta) at the NEWO binding domain that results in inhibition of IKKbeta at curvation and subsequent decreased phosphorylation of IKKbeta kinase compounds are useful for treating inflammatory disorders, e.g. asthma,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        bursitis; autoimmune diseases such as lupus, polymyalgia, scleroderma, granulomatosis, multiple sclerosis; transplant rejection; osteoporosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        pro-inflammatory responses such as allergies, urticaria, anaphylaxis, drug or food sensitivity, eczema, dermatitis, sunburn, aging and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel antiinflammatory compound comprising membrane translocation domain fused to NEMO binding sequence, useful for blocking nuclear factor kappaB activation, and for treating asthma, lung inflammation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Alzheimer's disease; atherosclerosis; viral infections; and ataxia telangiectasia. The compounds are also useful for treating

Human IKKbeta mutant D738E.

(first entry)

14-JUN-2002

ABB77305;

```
The present invention relates to antiinflammatory compounds comprising NEMO binding domain (NBD) peptides. The NEWO binding domains are common on IkappaB kinase-beta (IKACALa) and IkappaB kinase-alpha from control on IkappaB kinase-beta (IKACALa) and IkappaB kinase-alpha are useful for modulating nuclear factor-kappaB (NF-kappaB) induction in a cell, where the compounds are capable of blocking the interaction that a cell, where the compounds are sixthera, and NEMO. The antiinflammatory compound further comprises at least one membrane translocation domain. The compounds are useful for treating inflammatory disorders, autoimnume diseases, osteoporosis, cancer, Alzheimer's disease, atherosclerosis, viral infections, Ataxia telangiectesia, and for transplantation detection. The compounds of the invention block NF-kappaB induction by IKK but do not inhibit the basal activity of NF-kappaB ABU08418 -ABU08432 represent human
                                                                                                                                                IkappaB kinase-bera; IkappaB kinase-alpha; IKKalpha; NF-kappaB; nuclear factor-kappaB induction; inflammatory disorder; autoimmune disease; osteoporosis; cancer; Alzheimer's disease; atherosclerosis; viral infection; Ataxia telangiectasia; transplantation detection; immunosuppressive; osteopathic; cytostatic; nootropic; neuroprotective; antiatherosclerotic; virucide; vasotropic; antirheumatic; antiathritic; mutant; mutein.
                                                                                                                                  Human; antiinflammatory compound; NEMO binding domain; NBD; IKKbeta;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel antiinflammatory peptide compounds comprising NEMO binding domain, useful for modulating NF-kappaB induction in a cell and for treating NF-kappaB-mediated inflammation disorders e.g., asthma,
                                                                                          Human NEMO binding site (NBD) mutant peptide #6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 22; Page 17; 47pp; English.

The invention relates to modulating NF-kappaB (NF-kB) induction in a cell comprises contacting a cell with an anti-inflammatory compound (ABB0877313). The comprising at least one NEWO binding domain (ABB0877313). The compound has acts through selective inhibition of cytokine-mediated NF-kB activation by blocking the interaction of NEWO cytokine-mediated NF-kB activation by blocking the interaction of NEWO control of IKADPAB in the NEWO CC cytokine sectivation and subsequent decreased phosphorylation of IKADPAB. The compound may also cat (directly or indirectly) by blocking the recruitement of leukocytes into sites of acute and chronic inflammation, by down-regulating the expression of E-selectin on leukocytes or by blocking osteoclast confidence of into sites of acute and chronic inflammatory disorder. Although the compound is useful in treating NF-kB mediated conditions, where the condition is an inflammatory disorder.

CC Altheimer's disease, transplant rejection, osteoporosis, cancer, autoimmune disease, transplant rejection, osteoporosis, cancer, conditions, where the inflammatory disorder is asthma, allergies, creaming the inflammatory disorder is asthma, allergies, creaming conditions and proposition or ataxia continued activities, osteoarthritis, psociatic arthritis, lupus and burshitis. The inflammatory disorder may also be dermatitis, conditions of psociasis, osteoarthritis, psociatic arthritis, lupus and spocial sistemed by Epstein-bark, crown's disorder may also be dermatitis, crown's disorder may also be dermatitis, crown's disorder may also be dermatitis, crown's disorder may also be dermatitis, crown's disorder may also be dermatitis, crown's disorder may also be dermatitis, crown's disorder may also be dermatitis, crown's disorder may also be dermatitis, crown's disorder may also be dermatitis, crowned by Epstein-bark, crown's disorder way also be dermatitis, crowned by Epstein-bark, crown's disorder way also be dermatitis, crowned by Epstein-bark, crowned by Epstein-bark, crowned by Epstein-bark
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Modulating NF-kappaB induction in a cell, useful for treating e.g. inflammatory disorders, osteoporosis and cancer, comprises contacting a cell with an anti-inflammatory compound comprising at least one NEMO

subsequent decreased phosphorylation of IkappaB. The compound may also act (directly or indirectly) by blocking the recruitment of leukocytes inco sites of acute and chronic inflammation, by down-regulating the expression of E selectin on leukocytes or by blocking osteoclast differentiation. The compound is useful in treating NP-kB mediated conditions, where the condition is an inflammatory disorder, an autoimmune disease, transplant rejection, osteoporosis, cancer, Alzheimer's disease, transplant rejection, osteoporosis, cancer, Alzheimer's disease, atherosclerosis, a viral infection or ataxia telammatory disorder is asthma, allergies, utticaria, anaphylaxis, cutaneous inflammation, sepsis, psoriasis, rheumatoid arthritis, osteoarthritis, psoriatic arthritis, inflammatory disease, vasculitis and bursitis. The inflammatory disorder may also be dermatitis, espendylarthritis, psoriatic arthritis, lupus and poor boxel disease, chronic obstructive pulmonary disease, vasculitis, psoriatic arthritis, lupus and spondylarthritis. Also for Crohn's disease, ulcerative colitis, cryoglobulinaemia or multiple sclerosis. For chronic viral infections caused by Epstein-barr, cytomegalovirus or herpes simplex. Other viral diseases include HIV and influenza. The compound may also be useful for treating anaphylaxis, drug and food sensitivity, contact dermatitis, and suburn or aging. The compound may be used to replace corricosteroids in any application in which corricosteroids are used, including in the compound may be used to replace in a multiple sclerosis. The compound may be used in the compound may be used to replace corricosteroids in any application in which corricosteroids are used, including in the compound may be used to replace in a multiple sclerosis.

sunburn or aging. The compound may be used to replace corticosteroids in any application in which corticosteroids are used, including immunosuppression in transplants and cancer therapy. Also for identifying antiinflammatory compounds and for diagnosis of an inflammatory disorder. The compound may be administered alone or in combination with other known anti-inflammatory agents. The present sequence is that of an IKKbeta mutant, useful in examples of the invention.

Note: The present sequence is not given in the specification but is derived from GenBank Accession No. 014920 (ABB77294).

```

The invention relates to modulating NF-kappaB (NF-kB) induction in a cell comprises contacting a cell with an anti-inflammatory compound (ABB08725-ABB08742) comprising at least one NEMO binding domain (ABB77313). The compound has acts through selective inhibition of cytokine-mediated NF-kB activation by blocking the interaction of NEMO with IKKbeta at the NEMO binding domain. Blockage of IKKbeta-NEMO interaction results in inhibition of IKKbeta kinase activation and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AMM48620-AMM48645), comprising a membrane translocation demain.

(AAM48620-AMM48645), comprising a membrane translocation domain (AAM48620-AMM48645), comprising a membrane translocation domain acid residues, fueed to a NEWO binding sequence

(AAM48625-AAM48619). The antiinflammatory compounds have antiasthmatic, cytostatic, antipsoriatic, antitheumatory compounds have antiasthmatic, antiabacterial, immunosuppressive, dermatological, neuroprotective, contropic, antiatherosclerotic, virucide and antiallergic activity. The compounds act as selective inhibitors of cytokine-mediated NFkappaB activation by blocking interaction of IkappaB kinase beta (IKKbeta) at the NEMO binding domain that results in inhibition of IKKbeta kinase activation and subsequent decreased phosphorylation of IKAppaB. The compounds are useful for treating inflammatory disorders, e.g. asthma, lung inflammation or cancer, psoriasis, rheumatoid arthritis, osteoperosis, osteoathritis, inflammatory bowel disease, sepsis, vasculitis, useful multiple sclerosis; transplant rejection; osteoporosis; pro-inflammatory responses such as allergies, urticaria, and ataxia telangiactesia. The compounds are also useful for treating pro-inflammatory responses such as allergies, urticaria, anaphylaxis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antinflammatory; antiaethmatic; cytostatic; antipsoriatic; nootropic; antirheumatic; antiarthritic; osteopathic; antibacterial; virucide; immunosuppressive; deriarthritic; osteopathic; antiatherosclerotic; antiallergic; membrane translocation domain; NEWO binding domain; eczema; cytokine; NFkappaB; IkappaB kinase beta; IKKbeta; cancer; psoriasis; rheumatorid arthritis; osteoarthritis; inflammatory bowel disease; autoimmune disorder; multiple sclerosis; transplant rejection; osteoporosis; Alzheimmer's disease; atherosclerosis; viral infection;
                                                       Novel antiinflammatory compound comprising membrane translocation domain fused to NEMO binding sequence, useful for blocking nuclear factor kappaB activation, and for treating asthma, lung inflammation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                            The invention relates to an antiinflammatory compound (especially

The invention relates to an antiinflammatory compound (especially AAM48629-AAM48645), comprising a membrane translocation domain (AAM48620-AAM48645), comprising a membrane translocation domain (AAM48620-AAM48645). The antiinflammatory compounds have antiasthmatic, cytostatic, antipsoriatic, antitheumatic, antiarthritic osteopathic, antiabacterial, immunosuppressive, dermatological, enuroprotective, notropic, antiatheroselerotic, virucide and antiallargic activity. The compounds act as selective inhibitors of cytokine-mediated NFkappa8 activation by blocking interaction of Ikappa8 kinase beta (IKKbeta) at the NEMO binding domain that results in inhibition of IKAppa8. The compounds are useful for treating inflammatory disorders, e.g. asthma, inflammation or cancer, psoriasis, rheumatoid arthritis, osteoparthritis, inflammatory bowel disease, sepsis, vasculitis, osteoparthritis, inflammatory bowel disease, sepsis, vasculitis, osteoporosis, discinging autoimmune diseases such as lupus, polymyalgia, scleroderma, granulomatosis, multiple sclerosis, transplant rejection; osteoporosis, all lareimer's disease, atherosclerosis, viral infections; and ataxia telangiactasia. The compounds are also useful for treating infections anaphylaxis, pro-inflammatory responses such as allergies, urticaria, anaphylaxis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; antiinflammatory compound; NEMO binding domain; NBD; IKKDeta; IkappaB kinase-alpha; IKKalpha; NF-kappaB; nuclear factor-kappaB induction; inflammatory disorder; autoimmune disease; osteoporosis; cancer; Alzheimer's disease; atherosclerosis; viral infection; Ataxia telangiectasia; transplantation detection; immunosuppressive, osteopotathic; cytostatic; nootropic; neuroprotective; antiatherosclerotic; virucide; vasotropic; antiatherosclerotic; virucide; vasotropic; antiatherosclerotic; mutant; mutein.
                                                                                                                                                                                                                                                                                                   Novel antiinflammatory compound comprising membrane translocation domain fused to NEMO binding sequence, useful for blocking nuclear factor kappaB activation, and for treating asthma, lung inflammation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     or food sensitivity, eczema, dermatitis, sunburn, aging and

AMM48620-AMM48645), comprising a membrane translocation domain (AAM48620-AAM48645), comprising a membrane translocation domain (AAM48620-AAM48645), comprising a membrane translocation domain (AAM48620-AAM48619). The antiinflammatory compounds have antiasthmatic, attipacterial, immunosuppressive, dermatological, neuroprotective, notropic, antiatherosclerotic, virucide and antiallergic activity. The compounds act as selective inhibitors of cytokine-mediated NFkappaB contropic, antiatherosclerotic, virucide and antiallergic activity. The compounds act as selective inhibitors of cytokine-mediated NFkappaB contropic, antiatherosclerotic, virucide and antiallergic activity. The compounds act as selective inhibitors of cytokine-mediated NFkappaB activation by blocking interaction of KappaB kinase beta (IKKbeta) at the NFWO binding domain that results in inhibition of IKkbeta at the NFWO binding domain that results in inhibition of IKkbeta in the of compounds are useful for treating inflammatory discorders, e.g. asthma, ung inflammation or cancer, psoriasis, rheumatoid arthritis, osteoporosis, attoimmune diseases such as lupus, polymyalgia, scleroderma, burshilts, antoimmune diseases such as lupus, polymyalgia, scleroderma, compounds are also useful for treating the calcinos; and ataxia telangiectasia. The compounds are also useful for treating and traxia drug or food sensitivity, eczema, dermatitis, sunburn, aging and arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antinflammatory, antiasthmatic; cytostatic; antipsoriatic; nootropic; antirheumatic; antiarthritic; osteopathic; antibacterial; virucide; immunosuppressive; dermacological; neuroprotective; antiatherosclerotic; antiallergic; membrane translocation domain; NEMO binding domain; eczema; cytokine; NFkappaB; IkappaB kinase beta; IKKbeta; cancer; psoriasis; rheumatoid arthritis; osteoarthritis; inflammatory bowel disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel antiinflammatory compound comprising membrane translocation domain fused to NEMO binding sequence, useful for blocking nuclear factor kappaB activation, and for treating asthma, lung inflammation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an antiinflammatory compound (especially

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antiinflammatory; antiasthmatic; cytostatic; antipsoriatic; nootropic; antirheumatic; antiarthritic; osteopathic; antibacterial; virucide; immunosuppressive; dermatological; neuroprotective; antiatherosclerotic; antiallergic; membrane translocation domain; NEWO binding domain; eczema; cytokine; NFkappaB; IkappaB kinase beta; IKKbeta; cancer; psoriasis; rheumatoid arthritis; osteoarthritis; inflammatory bowel disease; autoimmune disorder; multiple sclerosis; transplant rejection; osteoporosis; Alzheimar's disease; atherosclerosis; viral infection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to antiinflammatory compounds comprising NEMO binding domain (NEMD) peptides. The NEMO binding domains are found on IkappaB kinase-bera (IKKbeta) and IkappaB kinase-lpha (IKKalpha) proteins. The antiinflammatory compounds of the invention are useful for modulating nuclear factor-kappaBB (NE-kappaB) induction in a cell, where the compounds are capable of blocking the interaction between one or more IKKs such as IKKalpha or IKKbeta, and NEMO. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    antiinflammatory compound further comprises at least one membrane transflocation domain. The compounds are useful for treating inflammatory disorders, autoimmune diseases, osteoporosis, cancer, Alzheimer's disease, atherosclerosis, viral infections, Ataxia telangiectasia, and for transplantetion detection. The compounds of the invention block NF-kappas induction by IKK but do not inhibit the basal activity of NF-kappaB. ABU08418-ABU08432 represent human

                                                                                                                                                                                                                                                                                                                                                                              AMM48629. AAMM8645), comprising amenbramment constitution domain (Applead 20-AAMM8645), comprising amenbramment) comprises from 6-15 amino acid residues, fused to a NEWO binding sequence from 6-15 amino acid residues, fused to a NEWO binding sequence from 6-15 cytostatic, antiporiatic, antirheumatic, antiarthritic, osteopathic, antibacterial, immunosuppressive, dermatological, neuroprotective, notropic, antiatherosclerotic, virucide and antiallergic activity. The compounds act as selective inhibitors of cytokine-mediated NFkappaB compounds act as selective inhibitors of cytokine-mediated NFkappaB cativation by blocking interaction of IkappaB kinase beta (IKKbeta) at the NEMO binding domain that results in inhibition of IkappaB. The compounds are useful for treating inflammenty disorders, e.g. asthma, lumg inflammation or cancer, posciasis, rheumatoid arthritis, osteoarthritis, inflammatory bowel disease, sepsis, vasculitis, costeoarthritis, autoimmune diseases such as lupus, polymyalgia, scleroderma, granulomatosis, multiple sclerosis; transplant rejection; osteoporosis; callandariar's disease, atherocolerosis; viral infections; and ataxia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    telangiectasia. The compounds are also useful for treating pro-inflammatory responses such as allergies, urticaria, anaphylaxis,
                                                                                                                                                                                                                                                                             Novel antiinflammatory compound comprising membrane translocation domain fused to NEMO binding sequence, useful for blocking nuclear factor kappaB activation, and for treating asthma, lung inflammation,
autoimmune disorder; multiple sclerosis; transplant rejection; osteoporosis; Alzheimer's disease; atherosclerosis; viral infection; ataxia telanglectasia; allergy; anaphylaxis; arthritis.
                                                                                                                                                                                                                                                                                                                                                                     invention relates to an antiinflammatory compound (especially

(AAM48525-AAM48619). The antinflammatory compounds have antiasthmatic, cytostatic, antiporatatic, antirheumatory compounds have antiasthmatic, cytostatic, antiporatatic, antirheumatory compounds have antiasthmatic, cytostatic, antiporatatic, antirheumatic, antiarhitic, osteopathic, corpounds act as nelective, included and antiallergic activity. The compounds act as selective inhibitors of cytokine-mediated NFkappaB cortivation by blocking interaction of IkappaB kinase beta (IKKbeta) at the NEMO binding domain that results in inhibition of IkappaB. The activation and subsequent decreased phosphorylation of IkappaB. The compounds are useful for treating inflammatory disorders, e.g. asthma, lum inflammation or cancer, psoriasis, rheumatoid arthitis, osteoarthritis, inflammatory bowel disease, sepsis, vasculitis, bursitis; autoimmune diseases such as lupus, polymyalgia, scleroderma, granulomatomis, multiple sclerosis; viral infections; and ataxia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1-Kappa-B kinase (AAW96158), deletion mutants of it retaining
I-kappa-B kinase activity and I-kappa-B polypeptides (comprising a ix residue domain of I-kappa-B containing one of Ser33 and Ser36, and a candidate agent) can be used to screen for agents that cand activity of the modulation of the kinase activity of IKK-alpha forms a method for modulating signal transduction involving 1-kappa-B in a cell.

The IKK-alpha polypeptides are useful for generating oligonucleotide primers and probes for use in the isolation of natural IKK-alpha chroding nucleic acids. The nucleic acids are useful as transcripts, Mybridization probes, polymerase chain include IKK-alpha ableles and primers. Their diagnostic applications include IKK-alpha ableles in clinical and laboratory samples.

Therapeutic application includes the use of IKK-alpha nucleic acids for modulating callular expression or intracellular concentration/availability of active IKK-alpha.

Catalytically inactive IKK-alpha mutants suppress NF-kappa-B cativation induced by tissue necrosis factor (TRAF) and NF-kappa-B-inducing kinase (NIK) oversuppression. Polypeptides of IKK-appa-B-inducing kinase (NIK) oversuppression. Polypeptides of NF-kappa-B-inducing kinase (NIK) oversuppression. Polypeptides of Leu604, Thr679, Ser680, pro684, Thr686 or Ser687 of the full length of the invention of the invention of the invention.
                                                                                                                                                                                                                             I-kappa-B kinase; IKK-alpha; gene expression; modulation;
suppression; activation; tumour necrosis factor; TNF; interleukin-1;
IL-1; TNF receptor associated factor; TRAF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       comprise at least one of these regions.
N.B. The present sequence is not given in the present specification
but is derived from the sequence given in AAW96157 as specified.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Newly isolated human kinase IkappaB Kinase (IKK-^a) polypeptides - meeful in screening for agents that modulate the interaction of an IKK polypeptide to a binding target and for modulating signal transduction involving IkappaB in a cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Similarity 83.3%; Score 36; DB 20; Length 9; Similarity 83.3%; Pred. No. 9.3e+05; 5; Conservative 1; Mismatches 0; Indels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cao Z,
```

```
The invention relates to an antiinflammatory compound (especially AAM48645), comprising a membrane translocation domain (AAM48629-AAM48645), comprising a membrane translocation domain (AAM48620-AAM48645), compounds for AAM48651) which comprises from 6-15 amino acid residues, fused to a NEWO binding sequence (AAM48525-AAM48619). The antiinflammatory compounds have antiasthmatic, cytostatic, antipacriatic, antirheumatic, antiarthritic, osteopathic, antibacterial, immunosuppressive, dermatological, neuroprotective, nootropic, antiafherosclerosic, virucide and antiallergic activity. The compounds act as selective inhibitors of cytokine-mediated NEKappaB activation by blocking interaction of IkappaB kinase beta (IKKOtca kinase activation and subsequent decreased phosphorylation of IkappaB. The compounds are useful for treating inflammation of IkappaB. The activation and subsequent decreased phosphorylation of IkappaB. The compounds are useful for treating inflammation of IkappaB. The activation or cancer, psoriasis, rheumatoid arthritis, unflammatory bowel disease, sepsis, vasculitis, bursitis, unlimbactoria, all second as lupus, polymyladia, scleroderma, cannot activation and subsequent decreases such as lupus, polymyladia, scleroderma, cannot activation and subsequent diseases such as lupus, polymyladia, scleroderma, cannother activation and subsequent diseases, viral infections; and ataxia and ataxia and activation and activation and activation and activation and activation and activation and activation and activation and activation and activation and activation and activation and activation and activation and activation and activation and activation and activation and activation and activation and activation and activation and activation and activation and activation and activation and activation and activation and activation and activation and activation and activation and activation and activation and activation and activation and activation and activation and activation and activation and activation and activ
                                                                                                                                                                                       Antinflammatory; antiasthmatic; cytostatic; antipsoriatic; nootropic; antirheumatic; antiarthritic; osteopathic; antibacterial; virucide; immunosuppressive; dermatological; neuroprotective; antiatherosclerotic; antiallergic; membrane translocation domain; NEWO binding domain; eczema; cytokine; NFkappaB; IkappaB kinase beta; IKKbeta; cancer; psoriasis; rheumatoid arthritis; osteoarthritis; inflammatory bowel disease; autoimmune disorder; multiple sclerosis; transplant rejection; osteoporosis; Alzheimer's disease; atherosclerosis; viral infection; ataxia telangiectasia; allergy; anaphylaxis; arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       pro-inflammatory responses such as allergies, urticaria, anaphylaxis, drug or food sensitivity, eczema, dermatitis, sunburn, aging and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel antiinflammatory compound comprising membrane translocation domain fused to NEMO binding sequence, useful for blocking nuclear factor kappaB activation, and for treating asthma, lung inflammation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Findeis MA, Phillips K;
                                                                                                                                      Anti-inflammatory peptide SEQ ID NO 29.

                                                                                                                                                                                                                                   ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an antiinflammatory compound (especially AAM48628-AAM48645), comprising a membrane translocation domain (AAM48628-AAM48645), comprising a membrane translocation domain and a comparises fused to a NEWO binding sequence (AAM48619). The antiinflammatory compounds have antiasthmatic, cytostatic, antiposoriatic, antiheratic antiathritic, osteopathic, antibacterial, immunosuppressive, dermatological, neuroprotective, compounds act as selective inhibitors of cytokine-mediated NFkappaB compounds act as selective inhibitors of cytokine-mediated NFkappaB cutivation by blocking interaction of IkappaB (insee beta (IKRobeta) at the NEWO binding domain that results in inhibition of IKRobeta kinase the NEWO binding domain that results in inhibition of IKRopea Fine compounds are useful for treating inflammatory disorders e.g. asthma, lung inflammation or cancer, psociasis, rheumatoid arthritis, osteoarthritis, inflammatory bowel disease, sepsis, vasculitis, osteoarthritis, antiple sclerosis; transplant rejection; osteoporosis, disease; atherosclerosis; transplant rejection; osteoporosis, calangiectasia. The compounds are also useful for treating to treating to treating to treating to treating to treating to the compounds are also useful for treating to pro-inflammatory responses such as allergies, urticaria, anaphylaxis, drug or food sensitivity, eczema, dermatitis, sunburn, aging and

The antiinflammatory compounds have antiasthmatic, cytostatic, antipsoriatic, antirheumatic, antiarthritic, osteopathic, antibacterial, immunosuppressive, dermaclogical, neuroprotective, nootropic, antiatheroscleroit, virucide and antiallergic activity. The compounds act as selective inhibitors of cytokine-mediated NFkappaB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    activation by blocking interaction of IkappaB kinase beta (IKKbeta) at the NEMO binding domain that results in inhibition of IKKbeta kinase activation and subsequent decreased phosphorylation of IkappaB. The compounds are useful for treating inflammatory disorders, e.g. asthma, lung inflammation or cancer, psoriasis, rheumatoid arthritis, osteoarthritis, inflammatory bowel disease, sepsis, vasculitis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel antiinflammatory compound comprising membrane translocation domain fused to NEMO binding sequence, useful for blocking nuclear factor kappab activation, and for treating asthma, lung inflammation,
                                                                                                                                                                                                                         Gape

                                                                                                                                                                                                                                                                                                   The invention relates to modulating NF-kappaB (NF-kB) induction in a cell comprises contacting a cell with an anti-inflammatory compound (ABB0773-ABB08742) comprising at least one NEMO binding domain (ABB077313). The compound has acts through selective inhibition of cytokine-mediated NF-kB activation by blocking the interaction of NEMO compound has acts through selective inhibition of new of interaction results in inhibition of IKKbeta kinase activation and subsequent decreased phosphorylation of IKKbeta kinase activation and cat (directly or indirectly) by blocking the recruitment of leukocytes incompound may also cat (directly or indirectly) by blocking the recruitment of leukocytes incompound may also cat (directly or indirectly) by blocking the recruitment of leukocytes conditions, where the compound is useful in treating NF-kB mediated conditions, where the condition is an inflammatory disorder, an anticaria, anaphylaxis, cutaneous inflammatory disorder, and activated conditions and the inflammatory disorder is asthma, allergies, cuticaria, anaphylaxis, cutaneous inflammation, sepsis, psoriasis, cremanical arthritis, sporiatic arthritis, luguas and bursitis. The inflammatory disorder may also be dermatitis, eczema, compound and issease, chronic obstructive pulmonary disease, vasculitis and spondylarthritis. Also for Crohn's granulomatosis, temporal arteritis, cryoglobulinaemia or multiple sclerosis, remporal arteritis, caryoglobulinaemia or multiple sclerosis. For chronic caryoglobulinaemia or multiple sclerosis. For chronic caryoglobulinaemia or multiple sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        caused by Epstein-barr, cytomegalovitus or herpes simplex. Other viral diseases include HIV and influenza. The compound may also be useful for treating anaphylaxis, drug and food sensitivity, context dermatitis, surburn or aging. The compound may be used to replace corticosteroids in any application in which corticosteroids are used, including immunosuppression in transplants and cancer therapy. Also for identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              antiinflammatory compounds and for diagnosis of an inflammatory disorder. The compound may be administered alone or in combination with other known anti-inflammatory agents. The present sequence is that of a mutated NEMO binding domain of IKKOeta.
                                                                                                                                                                                                           ๙
                                                                                                                                                                                      Modulating NF-kappaB induction in a cell, useful for treating e.g. inflammatory disorders, osteoporosis and cancer, comprises contacting cell with an anti-inflammatory compound comprising at least one NEMO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an antiinflammatory compound (especially AAM48628-AAM48645), comprising a membrane translocation domain (AAM48620-AM48645) comprises from 6-15 amino acid residues, fused to all membrane translocation domain (AAM48525-AAM48619). The antiinflammatory compounds have antiasthmatic, cytostatic, antipsoriatic, antisheumatic, antiarthritic, osteopathic, antibacterial, immunosuppressive, dermatological, neuroprotective, nootropic, antiatherosolerotic, virucide and antiallergic activity. The compounds act as selective inhibitors of cytokine-mediated NFkappaB activation by blocking interaction of IkappaB kinase beta (IKKbeta) at the NEMO binding domain that results in inhibition of IKkbeta kinase activation and subsequent decreased phosphorylation of Ikkbeta kinase compounds are useful for treating inflammatory disorders, e.g. asthma,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     lung inflammation or cancer, psoriasis, rhematoid arthritis, osteoarthritis, inflammatory bowel disease, sepsis, vasculitis, bursitis; autoimmune diseases such as lupus, polymyalgia, scleroderma, granulomatosis, multiple sclerosis; transplant rejection; osteoporosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel antiinflammatory compound comprising membrane translocation domain fused to NEMO binding sequence, useful for blocking nuclear factor kappaB activation, and for treating asthma, lung inflammation,

ABB77303;

```
The present invention relates to antiinflammatory compounds comprising NEMO binding domain (NBD) peptides. The NEMO binding domains are found on IMappas kinase-beta (IKKDeta) and IKappas kinase-beta (IKKDeta) and IKappas kinase-alpha and IKASlpha) proteins. The antiinflammatory compounds of the invention are useful for modulating nuclear factor-kappas (NF-kappas) induction in a cell, where the compounds are capable of blocking the interaction between one or more IKKs such as IKKBalpha or IKKDeta, and NEMO. The antiinflammatory compound further comprises at least one membrane inflammatory disorders, autoimmung aleases, osteoporosis, cancer, inflammatory disorders, autoimmung diseases, osteoporosis, cancer, that all and for transplantation detection. The compounds of the invention block NF-kappas induction by IKK but do not inhibit the basal activity of NF-kappas. ABU08418-ABU08432 represent human are not inhibit.
                                                                                                                                                IkappaB kinase-beta; IkappaB kinase-alpha; IKKalpha; NF-kappaB; nuclear factor-kappaB induction; inflammatory disorder; autoimmune disease; osteoporceis; cancer, Alzheimer's disease; atherosclerosis; viral infection; Ataxia telangiectasia; transplantation detection; immunosuppressive; osteopathic; cytostatic; noorropic; neuroprotective; antiatherosclerotic; virucide; vasotropic; antiatherosclerotic; virucide;

The invention relates to modulating NF-kappaB (NF-kB) induction in a cell comprises contacting a cell with an anti-inflammatory compound.

CABBOR723-ABBOR72) comprising at least one NEWO binding domain (ABBOR7313). The compound has acts through selective inhibition of cytokine-mediated NF-kB activation by blocking the interaction of NEWO binding domain. Blockage of IKKbeta-NEWO interaction results in inhibition of IKKbeta kinase activation and subsequent decreased phosphorylation of IKKbeta kinase activation and chromic inflammatory by down-regulating the expression of E-selectin on leukocytes or by blocking osteoclast conditions, where the compound is useful in treating NF-kB mediated conditions, where the condition is an inflammatory disorder; an autoimmune disease, transplant rejection, osteoporosis, cancer, autoimmune disease, transplant rejection, osteoporosis, cancer, conditions, where the condition is an inflammatory disorder in an antiflammatory disease, atheroselerosis, a viral infection or ataxia telangiectasia. The inflammatory disorder is asthma, allergies, uritaria, anaphylaxis, cutaneous inflammation, sepsis, psoriasis, crecoarthritis, psoriatic arthritis, lupus and bursitis. The inflammatory disorder may also be dermatitis, conditions condylarthritis, also for Crohn's disease, ulcerative collitis, sporiasis, osteoarthritis, psoriatic arthritis, lupus and sporiations sporiations arthritis, raiso for Crohn's disease, ulcerative collitis, sporiatis or spondylarthritis. Also for Crohn's disease, ulcerative collitis, coleroderma, wegner's granulomatosis, temporal arteritis, caused by Epstein-barr, cytomegalovirus or herpes simplex. Other viral diseases include HIV and influence or herpes simplex, contact dermatitis, or treating anaphylaxis, drug and food sensitivity, contact dermatitis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Modulating NF-kappaB induction in a cell, useful for treating e.g. inflammatory disorders, osteoporosis and cancer, comprises contacting a cell with an anti-inflammatory compound comprising at least one NEMO

The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory presence or absence of P. acnes in a patient comparises contacting the sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The
sunburn or aging. The compound may be used to replace corticosteroids in any application in which corticosteroids are used, including immunosuppression in transplants and cancer therapy. Also for identifying antiinflammatory compounds and for diagnosis of an inflammatory disorder. The compound may be administered alone or in combination with other known anti-inflammatory agents. The present sequence is that of an IKKbeta mutant, useful in examples of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SAPHO syndrome; synovitis; acne; pustulosis; hypertosis; osteomyelitis; uveitis; endopthelmitis; bone; joint; central nervous system; ELISA; inflammatory lesion; acne vulgaris; enzyme linked immunosorbent assay; dermatological; osteopathic; neuroprotectant.
                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for treating acne vulgaris -
                                                                                                                                   he present sequence is not given in the specification but is from GenBank Accession No. 014920 (ABB77294).

polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (BLISA).

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention relates to a novel method for identifying essential genes for survival or virulence of mycobacteria species. The method comprises aligning the genomic sequence of a first mycobacterium species on a genomic sequence of a second mycobacterium species and alelecting a polymucleotide sequence that is highly conserved in both genomes with no counterparts in other bacterial genomic sequences and that corresponds to an essential gene for the survival or virulence of mycobacterium species. The method of the invention is useful for detecting M. tuberculosis or M. leprae infection. The method reduces the number of potential new targets and protective antigens for new drugs and vaccine compositions to treat and prevent mycobacterial diseases, particularly tuberculosis and leprosy. The present sequence represents a marker protein from Mycobacterium tuberculosis and Mycobacterium leprae

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (ABBS7737-ABB72072).
The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention relates to a novel method for identifying essential genes for survival or virulence of mycobacteria species. The method comprises aligning the genomic sequence of a first mycobacterium species on a genomic sequence of a second mycobacterium species and selecting a polynucleotide sequence that is highly conserved in both genomes with no counterparts in other bacterial genomic sequences and that corresponds to an essential gene for the survival or virulence of mycobacterium species. The method of the invention is useful for detecting M. tuberculosis or M. leprae infection. The method reduces the number of potential new targets and protective antigens for new drugs and vaccine compositions to treat and prevent mycobacterial diseases, particularly tuberculosis and leprosy. The present sequence represents a marker

The present sequence is a MIM protein from Arabidopsis thaliana, which contributes to recombination repair of DNA damage in plant cells. The protein was tracked down with the help of a T-DNA tagged Arabidopsis mutant showing hypersensitivity to methyl methanesulphonate (MMS). It shows homology to a member of SNC (Structural Maintenance of Chromosomes) protein family and confers hypersensitivity to treatment with MMS, X-rays, UV light or mitomycin C. The present sequence is useful for DNA
     B type
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                               New Arabidopsis polynucleotide encoding protein useful for assisting recombinant repair of DNA damage in plants -

                                                                                                                                                                                                                                                                                                                                                                                                                  18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                             New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176 - ABL30511), expressed DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 MIM; recombination; plant; DNA repair; hypersensitivity; SMC protein family; Structural Maintenance of Chromosomes; MIM; methyl methanesulphonate; irradiation; mitomycin C.

                                               AAY78375 to AAY78415 represent peptides capable of inhibiting the human papillomavirus (HPV) B7 protein. The peptides have virucide activity. The peptides can be used in pharmaceutical compositions to inhibit HPV B7 protein, which allows the prevention and/or treatment of HPV associated diseases, which may comprise carcinomas.
       New peptides used for the prevention and treatment of human papilloma virus associated disease - \,
                                                                                                                                    .

The invention relates to nucleic acid sequences (AAV84411 to AAV84633) encoding human secreted proteins (AAV88534 to AAV88756). The secreted protein gene sequences are deposited with the ATCC under deposit numbers ATCC 97979, 97974, 97975, 97977, 209007, 209008, 209009, 209010, 209011, 209080, 209081, 209082, 209083, 209084, 209085, 209511. cells comprising recombinant vectors containing the nucleic acid
sequences are used for the recombinant production of the secreted
proteins. The polymucleotide and amino acid sequences are useful for are
useful for preventing, treating or ameliorating medical conditions e.g.
by protein or gene therapy. Pathological conditions can be also
diagnosed by determining the amount of the new polymeptides in a sample
or by determining the presence of mutations in the new polymucleotides.
Co by determining the presence of mutations in the new polymucleotides.
Co by determining the presence of mutations in the new polymucleotides.
Co by determining the amount of the polymucleotides in a sample
or by determining the presence of mutations in the new polymucleotides.
Co by determining the presence of mutations in the new polymucleotides.
Co by determining the presence of mutations in the new polymucleotides.
Co products for the diagnosis or treatment of cancer, neurodegenerative
disorders, developmental abnormalities and feetal deficiencies, blood
disorders, tumours, leukemias, disease of the immune system, autoimmune
cliseases, bhopatic and renal disease, lymphomas, inflammation, allergies,
clischemic shock, Alzheimer's and cognitive disorders involving osteoclasts
such as osteoporosis, arthritis or malignancies, diseases of testes,
lung or thymus, disestive/endocrine disorders, infections and AIDS. The
polypeptides are also useful for identifying their binding partners.
The present sequence represents human secreted protein (see descriptor.
The present sequence represents human secreted protein (see descriptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; secreted protein; immunomodulatory; antisclerotic; anti-HIV; dermatological; immunosuppressive; antiinflammatory; immunostimulant; cytostatic; cardiant; vascular; anti-angiogenic; ophthalmological; neuroprotective; nootropic; anticonvulsant; antialzheimers; vulnerary; antiparkinsonian; antimicrobial; gene therapy; vaccine; immune disorder; multiple sclerosis; systemic lupus erythematosus; HIV infection; cancer; human immunodeficiency virus; hyperproliferative disorder; wound healing; caucher a disease; cardiovacular disease; Scimitar syndrome; chemotaxis; corneal graft neovascularisation; diabetic retinopathy; regeneration; neurological disorder; Huntington's chorea; Alzheimer's disease; Parkinson's disease; chromosome 10.

proteins (I) and polynucleotide (II) sequences. (I) and (II) have various activities based on the tissues and cells the genes are expressed in.

Example of these activities include: immunomodulatory; antisclerotic; dermatological; immunosuppressive, antiinflammatory; immunostimulant; antipartinsonian; immunosuppressive, antiinflammatory; immunostimulant; antiparkinsonian; antimicrobial; anticonvulsant; antialzheimers; vascular; antiparkinsonian; antimicrobial; and vulnerary. (I) and (II) can be used in gene therapy and vaccine production. (I) and (II) can be used in the prevention, diagnosis and treatment of immune disorders (e.g. multiple sclerosis, systemic lupus erythematosus and human immunodeficiency virus (HIV) infections), hyperproliferative disorders (e.g. cancers and Gaucher's disease), cardiomyopathy and coronary arteriosclerosis; and openic disorders (e.g. corneal graft neovascularisation and diabetic retinopathy), neurological disorders (e.g. Huntington's chorea, Alzheimer's disease and Parkinson's disease), infectious diseases and/or for promoting wound healing, regeneration and/or chemotaxis. ABA813185 to ABA819193 and ABB50300 represent sequences used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ó,

The invention relates to a single exon nucleic acid probe (SENP) (I) for measuring human gene expression in a sample derived from human adult liver. comprising one of 13109 defined nucleotide sequences given in the specification (or complements/ fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which human liver single exon encoded peptides of the invention.

Note: The sequence information for this patent does not appear in the printed specification but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; foetal liver; gene expression; single exon nucleic acid probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

CC measuring human gene expression in a sample derived from human foetal
CC measuring human gene expression in a sample derived from human for inver. The single exon nucleic acid probes may be used for predicting,
CC liver. The single exon nucleic acid probes may be used for predicting,
CC maeauring and displaying gene expression in samples derived from human
CC moter the present sequence is a peptide encoded by a single exon
CC nucleic acid probe of the invention.
CN Note: The sequence data for this patent did not form part of the
CC printed specification, but was obtained in electronic format directly
CC from WIPO at ftp.wipo.int/pub/published_pct_sequences.
